

MOTIVATION

1. Current building energy consumption is not sustainable, but *pervasive computing* can help.
2. Power draw and maintenance concerns (i.e. recharging) prevent large-scale, long-term deployments.
3. Due to typical node synchronization methods, energy storage dominates node volume and dictates node lifetime.

U.S. Electricity Consumption By Sector, 2008

Department of Energy, 2009

VISION

```
On Room.Exited by Person as P:
  If Room.Occupancy is 0:
    Projector.Off()
    Lights.Off()
    Room.HVAC.UnMix(P.PreferredTemp)
```

PROPOSAL

Decouple Synchronization from Communication

- Outsource synchronization to external infrastructure
- Approach: Use visual light as a wake-up channel for synchronization

TIMELINE
